## Mole Ratios

## Mole Ratios I

How many moles of H atoms are in a mole of $\mathrm{H}_{2} \mathrm{O}$ molecules?
A. 1 mol H
B. 2 mol H
C. 2.0 mol H
D. 2.0 g H
$E$. None of the above

## Solution

## Answer: B

Justification: For every molecule of water, there are 2 hydrogen atoms. Thus, for every mole of water, there are 2 moles of hydrogen atoms.

The answer is not C because ratios don't have significant figures. For example, it isn't possible for there to be 2.2 hydrogen atoms for every molecule of water. Thus a decimal is not needed.

## Mole Ratios II

What mole ratio would you use when calculating how many moles of Hydrogen atoms are in 4.0 g of acetic acid $\left(\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}\right)$ ?

$$
\begin{array}{ll}
\text { A. } \frac{3 \mathrm{~mol} \mathrm{H}}{1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}} & \\
\text { B. } \frac{1 \mathrm{~mol} \mathrm{CH}}{3} \mathrm{CO}_{2} \mathrm{H} & \text { D. } \frac{1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}}{40.1 \mathrm{~g}}
\end{array}
$$

## Solution

## Answer: E

Justification: The answer could not be A or C because there are in total 4 hydrogen atoms in 1 molecule of acetic acid. Thus, for 1 mole of acetic acid, there would be 4 moles of hydrogen.

The answer is not $B$ because that is the molar mass of acetic acid, not the mole ratio that the question was looking for.

Finally, the answer was not $D$, because the mole ratio is in the wrong orientation to cancel out the units properly.

$$
4.0 \mathrm{~g} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H} \times \frac{1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}}{60.1 \mathrm{~g} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}} \times \frac{4 \mathrm{~mol} \mathrm{H}}{1 \mathrm{~mol} \mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}}
$$

## Mole Ratios III

## $\mathrm{H}_{2} \mathrm{CrO}_{4}+\mathrm{AgNO}_{3} \rightarrow \quad \mathrm{Ag}_{2} \mathrm{CrO}_{4}+\quad \mathrm{HNO}_{3}$ 59.0 g 169.9 g 165.9 g 63.0 g

The masses of all the reactants and products in
A. $0.5 \mathrm{~mol} / 1.5 \mathrm{~mol} / 1.0 \mathrm{~mol} / 1.0 \mathrm{~mol}$ the above equation are shown. How many moles of each reactant and product are used/made?
B. $0.5 \mathrm{~mol} / 1.0 \mathrm{~mol} / 1.0 \mathrm{~mol} / 0.5 \mathrm{~mol}$
C. $0.5 \mathrm{~mol} / 1.0 \mathrm{~mol} / 0.5 \mathrm{~mol} / 1.0 \mathrm{~mol}$
D. $1.0 \mathrm{~mol} / 1.0 \mathrm{~mol} / 1.0 \mathrm{~mol} / 1.0 \mathrm{~mol}$
$E$. None of the above

## Solution

## Answer: C

Justification: To calculate the number of moles of a substance you need to use molar mass to convert the mass of the substance to the number of moles of the substance.

For $\mathrm{H}_{2} \mathrm{CrO}_{4}$, the calculation would be:

$$
59.0 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{118.0 \mathrm{~g}}=0.5 \mathrm{~mol}
$$

Continued on next slide...

## Solution

Answer: C
Justification: The moles of the rest of the reactants and products are thus:
$\mathrm{H}_{2} \mathrm{CrO}_{4}+\mathrm{AgNO}_{3} \rightarrow \quad \mathrm{Ag}_{2} \mathrm{CrO}_{4}+\quad \mathrm{HNO}_{3}$
$59.0 \mathrm{~g} \quad 169.9 \mathrm{~g}$
165.9 g
63.0 g
$118.0 \mathrm{~g} / \mathrm{mol}$
$169.9 \mathrm{~g} / \mathrm{mol}$
$331.8 \mathrm{~g} / \mathrm{mol} \quad 63.0 \mathrm{~g} / \mathrm{mol}$
0.5 mol
1.0 mol
0.5 mol
1.0 mol

## Mole Ratios IV

## $\mathrm{H}_{2} \mathrm{CrO}_{4}+\mathrm{AgNO}_{3} \rightarrow \quad \mathrm{Ag}_{2} \mathrm{CrO}_{4}+\quad \mathrm{HNO}_{3}$ $0.5 \mathrm{~mol} \quad 1 \mathrm{~mol}$ <br> 0.5 mol <br> 1 mol

What is the mole ratio between $\mathrm{AgNO}_{3}$ and $\mathrm{Ag}_{2} \mathrm{CrO}_{4}$ ?
A. $1 \mathrm{~mol} \mathrm{AgNO}_{3} / 0.5 \mathrm{~mol} \mathrm{Ag}_{2} \mathrm{CrO}_{4}$
B. $2 \mathrm{~mol} \mathrm{AgNO}_{3} / 1 \mathrm{~mol} \mathrm{Ag}_{2} \mathrm{CrO}_{4}$
C. $1 \mathrm{~mol} \mathrm{Ag}_{2} \mathrm{CrO}_{4} / 2 \mathrm{~mol} \mathrm{AgNO}_{3}$
D. All of the above
E. None of the above

## Solution

## Answer: D

Justification: The reaction started with 1 mole $\mathrm{AgNO}_{3}$ which produced 0.5 moles of $\mathrm{AgCrO}_{4}$.

All of the answers given present some form of a 2:1 ratio which is the correct ratio between the reactant and the product.

## Mole Ratios V

## $\mathrm{H}_{2} \mathrm{CrO}_{4}+\mathrm{AgNO}_{3} \rightarrow \quad \mathrm{Ag}_{2} \mathrm{CrO}_{4}+$ $0.5 \mathrm{~mol} \quad 1 \mathrm{~mol}$ 0.5 mol <br> $\mathrm{HNO}_{3}$ <br> 1 mol

Knowing the amount of moles of each reactant and product, what coefficients would you use to balance the above equation?
A. $0.5 / 1 / 0.5 / 1$
B. $1 / 2 / 1 / 2$
C. $3 / 6 / 3 / 6$
D. All of the above
E. None of the above

## Solution

## Answer: B

Justification: All of the given answers show the correct ratios between the reactants and products. $B$ is the best solution however because the coefficients have been reduced to the lowest whole number ratio.

On occasion it is permissible to use a fraction over 2 (ex. 13/2) as a coefficient to prevent the other coefficients in the equation from getting very large.

## Mole Ratios VI

$$
\mathrm{Rb}+\mathrm{S}_{8} \rightarrow \mathrm{Rb}_{2} \mathrm{~S}
$$

Balance the above equation.
What is the mole ratio between $\mathrm{S}_{8}$ and Rb ?
A. $1 \mathrm{~mol} \mathrm{Rb} / 8 \mathrm{~mol} \mathrm{~S} 8$
B. $16 \mathrm{~mol} \mathrm{Rb} / 8 \mathrm{~mol} \mathrm{~S}_{8}$
C. $1 \mathrm{~mol} \mathrm{~S}_{8} / 16 \mathrm{~mol} \mathrm{Rb}$
D. $1 \mathrm{~mol}_{8} / 2 \mathrm{~mol} \mathrm{Rb}$
E. B and D

## Solution

## Answer: C

Justification: The balanced chemical equation is shown below with the coefficients of $16 / 1 / 8$.

The answer is not $A$ because the equation would have been balanced incorrectly to get that ratio.

The answer is not $B$, $D$, or $E$ because the subscript 8 in $S_{8}$ is not part of the mole ratio between the two reactants. Rather, it tells you that there are 8 atoms of $S$ in 1 molecule of $S_{8}$. Only the coefficients are part of the mole ratio.

The mole ratio between $\mathrm{S}_{8}$ and Rb is thus 16 mol of Rb for every 1 mol of $\mathrm{S}_{8}$.

$$
16 \mathrm{Rb}+1 \mathrm{~S}_{8} \rightarrow 8 \mathrm{Rb}_{2} \mathrm{~S}
$$

## Mole Ratios VII

$$
\mathrm{B}_{2} \mathrm{O}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow \quad \mathrm{H}_{3} \mathrm{BO}_{3}
$$

Balance the above equation.
If 14.0 g of $\mathrm{B}_{2} \mathrm{O}_{3}$ was used, what would the calculation look like to determine the amount of moles of $\mathrm{H}_{3} \mathrm{BO}_{3}$ that would be produced?
A. $14.0 \mathrm{~g} \times \frac{2 \mathrm{~mol}}{1 \mathrm{~mol}}$
C. $14.0 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{69.6 \mathrm{~g}} \times \frac{2 \mathrm{~mol}}{3 \mathrm{~mol}}$
B. $14.0 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{61.8 \mathrm{~g}} \times \frac{2 \mathrm{~mol}}{1 \mathrm{~mol}}$
D. $14.0 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{69.6 \mathrm{~g}} \times \frac{1 \mathrm{~mol}}{2 \mathrm{~mol}}$
E. None of the above

## Solution

## Answer: E

Justification: Based on the balanced chemical equation, the mole ratio between $\mathrm{B}_{2} \mathrm{O}_{3}$ and $\mathrm{H}_{3} \mathrm{BO}_{3}$ was a 1:2 ratio.

$$
\mathrm{B}_{2} \mathrm{O}_{3}+3 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{H}_{3} \mathrm{BO}_{3}
$$

Thus C is incorrect since the mole ratio that it used was 3:2.
The remaining answers had some combination of the mole ratios and the molar masses of $\mathrm{B}_{2} \mathrm{O}_{3}$ and $\mathrm{H}_{3} \mathrm{BO}_{3}$. It was easy to mix up what compound each mole ratio and molar mass referred to because the compounds were not explicitly stated in the calculation.

Continued on next slide...

## Solution

## Answer: E

## Justification:

The correct calculation needed to convert:
g of $\mathrm{B}_{2} \mathrm{O}_{3} \longrightarrow \mathrm{~mol}$ of $\mathrm{B}_{2} \mathrm{O}_{3} \longrightarrow \mathrm{~mol}$ of $\mathrm{H}_{3} \mathrm{BO}_{3}$
$14.0 \mathrm{~g} \mathrm{~B}_{2} \mathrm{O}_{3} \times \frac{1 \mathrm{~mol}_{2} \mathrm{O}_{3}}{69.6 \mathrm{~g}} \times \frac{2 \mathrm{~mol} \mathrm{H}_{3} \mathrm{BO}_{3}}{1 \mathrm{~mol} \mathrm{~B}_{2} \mathrm{O}_{3}}$

Good Practice Tip: To prevent mixing up which term refers to either the reactant or the product, it is a good idea to write which compound you are referring to in each step.

## Mole Ratios VIII

## $\mathrm{Sb}_{2} \mathrm{~S}_{3}+$ <br> $\mathrm{O}_{2} \rightarrow \quad \mathrm{Sb}_{2} \mathrm{O}_{3}+$

Balance the above equation.

How many liters of oxygen would you need (at STP) to react to produce 30.0 g of $\mathrm{Sb}_{2} \mathrm{O}_{3}$ ?
A. 10.4 L
B. $3.02 \times 10^{3} \mathrm{~L}$
C. 672 L
D. 0.512 L
E. None of the above

## Solution

Answer: A
Justification: The correct balanced equation is shown below:

$$
2 \mathrm{Sb}_{2} \mathrm{~S}_{3}+9 \mathrm{O}_{2} \rightarrow 2 \mathrm{Sb}_{2} \mathrm{O}_{3}+6 \mathrm{SO}_{2}
$$

The correct calculation needed to convert:

$$
\mathrm{g} \text { of } \mathrm{Sb}_{2} \mathrm{O}_{3} \longrightarrow \mathrm{~mol} \text { of } \mathrm{Sb}_{2} \mathrm{O}_{3} \longrightarrow \mathrm{~mol} \text { of } \mathrm{O}_{2} \longrightarrow \mathrm{~L} \text { of } \mathrm{O}_{2}
$$

The conversion factors that you need to achieve these steps are as follows:
$30.0 \mathrm{~g} \mathrm{Sb}_{2} \mathrm{O}_{3} \times \frac{1 \mathrm{~mol} \mathrm{Sb}_{2} \mathrm{O}_{3}}{291.5 \mathrm{~g}} \times \frac{9 \mathrm{~mol} \mathrm{O}_{2}}{2 \mathrm{~mol} \mathrm{Sb}_{2} \mathrm{O}_{3}} \times \frac{22.4 \mathrm{~L}}{1 \mathrm{~mol} \mathrm{O}_{2}}$
